## Board of Experts Consensus Statement

Considering

**World Psychiatric Association Madrid Declaration on Ethical Standards for Psychiatric Practice**

Approved by the General Assembly of the World Psychiatric Association in Madrid, Spain, on August 25, 1996, and enhanced by the WPA General Assemblies in Hamburg, Germany on August 8, 1999, in Yokohama, Japan, on August 26, 2002, in Cairo, Egypt, on September 12, 2005, and in Buenos Aires, Argentina, on September 21, 2011 and,

after being acquainted
with all the medical, social and ethical consequences of the Case Study M, the undersigned Board of Experts has approved the following Consensus Statement:

I. The retroactive analysis of all the medical findings and patient´s statements strongly support the logical coherence of the objective and subjective information.

II. The Posttraumatic Stress Disorder F43.1 (ICD-10, WHO); 309.81 (DSM-IV, APA) diagnosis was valid according to the criteria of both ICD-10 and DSM-IV.

III. Direct observation of the patient´s behavior, and formal standardized assessment process during diagnostic and therapeutic sessions granted objective phenomena further substantiating their credibility.

IV. Both therapists MUDr. Jozef Hašto, PhD. and Mgr. Hana Vojtová have abided in full extend the rules of the World Psychiatric Association Madrid Declaration on Ethical Standards for Psychiatric Practice.

V. From the health point of view further psychiatric and clinical psychological assessment in the context of criminal proceedings is considered to be unjustified, unethical and could represent a significant risk for relapse of PTSD.

VI. The participants of the expert panel registered their considerable concern that there are clear indications of the abuse of psychiatry, contrary to the tenets of the WPA Declaration, in this case.

*The panel members decided for ethical reasons, to retain anonymity of the individual, in this statement, notwithstanding that the individual concerned consented to use of their full name.
